

ABSTRACT

A program information display device is capable of using an electronic program guide using arbitrary attributes as axes of scatter diagram displaying program information, and allowing to find a desired program easily. Also, a program information display device has an electronic program guide capable of displaying program information at high degree of freedom without restriction of discrete layout. The program information display device is a program information display device for displaying program information in a scatter diagram disposed at a position conforming to related value about attribute of X-axis and related value about attribute of Y-axis, comprising program information storage, program information processing, program information display, and attribute input.
